POPULATION STUDIES CENTER
UNIVERSITY OF MICHIGAN

The Population Studies Center at the University of Michigan is one of the oldest population centers in the United States. Established in 1961 with a grant from the Ford Foundation, the Center has a rich history as the main workplace for an interdisciplinary community of scholars in the field of population studies. Today the Center is supported by a Population Research Center Core Grant from the National Institute of Child Health and Human Development (NICHD) as well as by the University of Michigan, the National Institute on Aging, the Hewlett Foundation, and the Mellon Foundation.

PSC Research Reports are prepublication working papers that report on current demographic research conducted by PSC associates and affiliates. The papers are written by the researcher(s) for timely dissemination of their findings and are often later submitted for publication in scholarly journals. The PSC Research Report Series was begun in 1981 and is organized chronologically. Copyrights are held by the authors. Readers may freely quote from, copy, and distribute this work as long as the copyright holder and PSC are properly acknowledged and the original work is not altered.

Minority Magnet Metros in the '90s

by William H. Frey

Research Report No. 98-418

July 1998

Abstract: While America is becoming a “melting pot,” from a national perspective, population shifts during the 1990s show continued geographic concentration of minority groups into specific regions and a handful of metro areas. This is especially the case for the new immigrant minorities — Hispanics and Asians — who are still most prone to enter major gateway cities, and remain in those regions. While there is some sprinkling out of these new ethnic minorities, the pace is relatively slow. The fact is, the largest blocks of Hispanic and Asian consumer groups, voters, and multi-lingual Americans are highly clustered in only a few metro areas. Most metro areas beyond these “multiple melting pots” are largely white, or white and black. In the 1990s especially, blacks have become increasingly drawn to “New South” metropolitan magnets — representing a reversal, and potential reconsolidation of African Americans in this region.

This report presents an analysis of 1990-96 race-ethnic growth for US metro areas and nonmetro counties. It also identifies “multiple melting pot metros” and counties which became “majority minority” in the 1990s.

Data set used: 1990-96 US Census Bureau Postcensal Estimates by Race-Ethnicity.

About the Author:

William H. Frey is a Ph.D Demographer and Research Scientist at the University of Michigan, Population Studies Center.

Minority Magnet Metros in the '90s

William H. Frey
Population Studies Center
University of Michigan

While America is becoming a "melting pot," from a national perspective, population shifts during the 1990s show continued geographic concentration of minority groups into specific regions and a handful of metro areas. This is especially the case for the new immigrant minorities -- Hispanics and Asians -- who are still most prone to enter major gateway cities, and remain in those regions. While there is some sprinkling out of these new ethnic minorities, the pace is relatively slow. The fact is, the largest blocks of Hispanic and Asian consumer groups, voters, and multi-lingual Americans are highly clustered in only a few metro areas. Most metro areas beyond these "multiple melting pots" are largely white, or white and black. In the 1990s especially, blacks have become increasingly drawn to "New South" metropolitan magnets -- representing a reversal, and potential reconsolidation of African Americans in this region.

Hispanic and Asian Magnets

Among the nation's 271 metro areas, Los Angeles houses fully one-fifth of the US Hispanic population. It also ranks first in terms of total growth, garnering almost one-fifth (18 percent) of Hispanic gains over the 1990s. The City of Angels' Hispanic growth comes largely from Mexican and Latin American immigrants, but also from the continued high fertility of long-term Hispanic "stayers." The importance of immigrant gateways in both attracting and maintaining large Hispanic populations can be seen in Table 1. The ten metro areas with the largest Hispanic populations were also the ten largest gainers -- attracting over half (52 percent) of US Hispanic gains in the first six years of the 1990s. (Collectively, they house 58 percent of the nation's Hispanic population.) This group includes Miami with its strong attraction for Cubans; New York City, gaining Dominicans, Puerto Ricans and other Caribbean-origin Hispanics; and Chicago, a continued magnet for Mexicans. The rest of the ten lie close to the Mexican border and continue to build on large, existing Latin American populations. One of the few exceptions to the "size begets growth" phenomenon lies with Las Vegas which benefited from "spillover" migration from California Hispanics, as well as the initial destination for some Latin American immigrants.

While Asians, like Hispanics, represent many distinct nationalities, the greatest gaining Asian metro areas are the three largest Asian populations. Together, Los Angeles, New York and San Francisco accounted for 38 percent of the nation's Asian population gains in the 1990s. (These three areas house 42 percent of all US Asians.) With Chinese a major immigrant group to New York, Filipinos are drawn heavily to Los Angeles, and both groups show a large presence in San Francisco. The next echelon of Asian-gaining metros also have significant Asian populations. However, Washington, DC, Houston, Seattle, and Dallas have recently increased the magnitudes of their Asian gains. Atlanta and Las Vegas are examples of two *non*-gateway metros which have begun to attract more Asians via both immigration and domestic migration. Nonetheless, the 20 metropolitan areas shown in Table 1, account

for 73 percent of 1990's Asian growth, and over three-quarters of the nation's Asian population.

Blacks and Whites

While most Hispanics and Asians can be found in gateway metros like Los Angeles, New York and San Francisco, African Americans are more highly dispersed with greatest concentrations in northern urban centers, and different parts of the South. Moreover, the greatest gaining metros for blacks in the 1990s are not located in California or along the Mexican border, but reflect a new attraction for blacks to the revitalized "New South." Metro Atlanta is emblematic of the new attractive markets for African Americans. With a booming economy, a large black middle class population, and familiar southern mores, middle class and working class blacks from all origins have made Atlanta the biggest gaining metro for African Americans in the 1990s. The same kinds of attractions are bringing more blacks back to Houston, Dallas-Ft. Worth, Raleigh-Durham, Charlotte and a host of other growing metros that dot the landscape of the Southeastern US (see Table 2). The large gains shown for northern metros like New York, Chicago and Philadelphia are deceptive since they represent natural increase that accrues to an already large black population, resulting from decades of past migration. These areas actually represent the origins of some of the larger streams leading to 1990's gains of several large, small and non-metropolitan areas in the South.

Even more so than African Americans, the non-Hispanic white "majority" population is widely dispersed across the country. Still, the list of greatest gaining metros makes plain that whites are attracted to a different set of places than the new immigrant minorities. Table 2 shows these areas to lie, mostly, in the booming Southeast, Texas, and Mountain States that lie outside of the California. These gains come, largely, from domestic migration following the growth of jobs in high-tech, knowledge-based industries (Atlanta, Dallas-Ft. Worth, Seattle, Minneapolis-St. Paul, Austin), as well as in services and construction (Las Vegas, Orlando). Another source for white gains is the allure of good climate and natural amenities for those of retirement age (e.g., Phoenix). Unlike the members of the new immigrant minority groups, whites are less "tied" to friends and family for social and economic support, and are more responsive to the growing economic opportunities in these Western and Southern States. In fact, the high cost of living and in some cases competition from low-skilled immigrants, are leading to an out-migration of whites from some of the nation's largest magnets for Hispanics and Asians. In the first six years of the 1990s, more than one-quarter of the nation's 271 metros lost population including those with struggling economies in the Northeast (e.g., Pittsburgh, Hartford, Providence, Springfield). However, the three largest white population losses accrued to New York, Los Angeles and San Francisco -- the greatest gaining metros for Hispanics and Asians. These patterns are consistent with earlier studies showing the movement of whites away from immigrant gateways toward other parts of the country (see Frey articles in *American Demographics*, April, 1994; November, 1996).

Minority Frontiers

While it is clear that the bulk of Hispanic and Asian-Americans continue to remain and grow within traditional gateway metro areas, this is not the case for all. There is evidence of some sprinkling out into "new frontiers" in parts of the country where most residents had never heard Spanish or Chinese being spoken; in suburbs, smaller metropolitan areas, and in rural towns. The major lure for today's ethnic pioneers often involves jobs. Both college graduates and unskilled laborers can find work in the booming parts of the country that up until now have attracted mostly whites and African Americans. Still, there is a demand for engineers, doctors, and college teachers as well as construction workers, service workers, and laborers in industries like food processing. One way to assess where these new minority frontiers are located is to examine counties where their *percentage growth* is high.

For Hispanics (see Table 4), these counties include the cities and suburbs of largely white-black metros like Atlanta, Raleigh-Durham-Chapel Hill, Charlotte, Greensboro-Winston Salem-High Point, as well as other parts of the growing Southeast part of the country. In addition, a number of urban and rural counties and largely white parts of America's mid-section (Nebraska, Iowa) and in the growing Rocky Mountain States (Idaho, Nevada) are showing high rates of Hispanic growth. It should be borne in mind that in most of these counties Hispanics represent only tiny fractions of the population and that only 463 of the nation's over 3000 counties gained as many as 1000 Hispanics during the first six years of the 1990s.

Asian-Americans, even more concentrated in gateway metros than Hispanics, still show plenty of pioneering migration. Fast-growing areas for them tend to be metro destinations which already have some Asian presence. Souther metros like Atlanta, Dallas-Ft. Worth, Washington-Baltimore and Raleigh-Durham-Chapel Hill are heavily represented among these fast-growing Asian counties. Urban professionals are heavily represented in this growth. Yet, Asian pioneers are also evident in America's mid-section, in Omaha and the suburbs of Minneapolis-St. Paul. Much of this Asian movement appears to be "chain migration" but it is still relatively circumscribed. Only 265 counties gained as many as 1000 Asian-Americans, thus far, in the 1990s.

The "pioneering" movement and outward spread of Hispanics and Asians to new parts of the country, stand in contrast to counties which showed sharp increases in African Americans (Table 6). For blacks, the 1990s represent both a "return" to the South but also some pioneering movement within the South. The latter represent new gains for blacks in the suburbs of fast-growing metros like Atlanta, Dallas-Ft. Worth, and Washington-Baltimore, along with a greater presence in parts of Florida which did not, in the past, have a large African American presence. Middle class blacks, in particular, are the vanguard of these new gains to the "New South." Yet, retirees who have spent most of their lives in northern and western cities are also attracted to many of the smaller, and more familiar rural counties of the South.

“Multiple Melting Pot” Metros

This paper has emphasized three ongoing geographic shifts: (1) the continued growth of Hispanics and Asians in traditional gateway metro areas; (2) a retreat from these areas by whites who are locating in growing western and southern areas of all sizes; and (3) a return of African Americans to the growing metro and rural areas in the South. Together, these trends do not conjure up the image of a national “melting pot” where most communities in all parts of the country have a strong presence of each major minority group. Rather, it suggests an image of “multiple melting pots” located in specific parts of the country whose populations include a significant presence of two or more minority groups. Through intermarriage, and the blending of cultures, each of these “melting pots” will develop its own politics, tastes for consumer items, and community personalities.

We have identified 21 such melting pot metros using a relatively stringent demographic definition. These are areas where the percentage of non-Hispanic whites is lower than its representation in the national population (73 percent), and where at least two of the minority groups have greater than their national representations (12 percent for Hispanics, 11 percent for non-Hispanic blacks) or at least 5 percent of the population (for Asians, or for American Indians/Eskimos). The list includes the three largest gateways: Los Angeles, New York, and San Francisco, as well as Chicago, Washington, DC, San Diego and Houston. The others on the list are relatively smaller areas and are located in California and Texas. By our definition, only New York has over-representations of as many as three minorities: blacks, Hispanics and Asians. The California metro areas are uniformly over-represented by Hispanics and Asians; whereas the Texas metros, along with Chicago, are over-represented in blacks and Hispanics. Intermingling of new immigrant minorities is most likely to occur in the California metro areas, and in New York City.

The short list of “multiple minority metros” does not mean that there is not a larger number of areas that has a significant share of only one of these minority groups. A good sense of the regional distribution of the single minority concentrations can be seen in Map 1 which plots areas where only one minority is over-represented (“white-black,” “white-Hispanic,” “white-Asian,” “or white-Indian/Eskimo” as well as those which are “multi-ethnic” where two are more minorities are over-represented). It is clear that African Americans are most over-represented in the South, with some important clusters in urban areas of the Northeast and Midwest regions. Hispanics comprise large shares of the population for counties that span the States of Texas west to California, and parts of adjoining States. The Asian presence is not very widespread according to this measure but there is a fair representation of American Indians in counties in Oklahoma, and in several States in the North Central part of the country. Multi-ethnic counties are most common in California and the Southwest with mixes of Hispanics and Asians, Hispanics and American Indians being commonplace. Yet, the most notable part of this map is a broad swath of States in the Northeast, Midwest, Rocky Mountains, and Northwest that are mostly white, and where none of the major minority groups comes close to approximating their national percentages of the population. Of 3142 US counties in 1996 only 745 show white populations below the national white percentage (73 percent), and well over half (1711) are at least 90 percent white.

In 1996, there were 226 counties where whites represented the minority. Most of these were smaller counties in Texas and the rest of the Southwest where Hispanics are in the majority, or rural counties in the South where blacks are in the majority. Still, between 1990 and 1996, 43 counties turned from "majority white" to "majority minority." The largest of these (shown on Table 9) are emblematic of where whites will be in the minority. These include inner counties of older, largely white-black metropolitan areas (Philadelphia, St. Louis) where the change is being fueled, mostly, by traditional white flight to the suburbs and beyond. But in the rest, the change is being driven, as well, by infusions of new minority populations: Hispanics and Asians in the California counties Alameda, Fresno, Tulare, Monterey, and Merced, in mostly black gains in the Georgia counties of DeKalb and Richmond. In gains from all three groups in Fort Bend County, Texas, which exceed the gains for whites. These latter changes in selected parts of the Southwest will turn into the much publicized "majority minority" cities in America. Yet, outside of these distinct regions, the pattern of race and ethnic change will move at a more glacial pace.

Metro/Non-metro Dimension

While much of this overview has focused on metropolitan areas, it is important to emphasize that both the new ethnic minorities and African Americans are more prone to locate in metropolitan areas than are whites. As of 1996, close to 95 percent of Asians, over 91 percent of Hispanics, and better than 85 percent of blacks resided in metropolitan areas, and the plurality of all three groups were located in metropolises with populations exceeding 1 million. In contrast, the share of the US white population residing in non-metropolitan areas is approaching one-quarter, and less than half reside in the nation's biggest metro areas. This represents an additional dimension to our view of race and region as the country moves toward the Twenty-first Century. It is important to understand that our fastest growing minority populations will continue to be concentrated in large urban "multiple melting pots." The demographics, life styles, tastes and voting patterns in these areas are likely to change dramatically. For the rest of America, change will come more slowly. "Majority minority" areas will be few and far between, as suburbs and exurbs in the South and Mountain West become more popular places to live and work.
